Quick Start Guide

Sequentially Constructive Statecharts (SCCharts)

SCCharts [5] is a visual synchronous language that is designed for specifying safety-critical reactive systems. SCCharts uses a new statechart notation similar to Harel Statecharts [3] and provides deterministic concurrency based on a synchronous model of computation (MoC), without restrictions common to previous synchronous MoCs like the Esterel constructive semantics [2]. Specifically, we lift earlier limitations on sequential accesses to shared variables, by leveraging the sequentially constructive MoC [4]. Thus SCCharts in short are SyncCharts [1] syntax plus Sequentially Constructive semantics.

The key features of SCCharts are defined by a very small set of elements, the Core SCCharts, consisting of state machines plus fork/join concurrency.

Conversely, Extended SCCharts contain a rich set of advanced features, such as different abort types, signals, history transitions, etc., all of which can be reduced via semantics preserving model-to-model (M2M) transformations into Core SCCharts. Extended SCCharts features are syntactic sugar because they can be expressed by a combination of Core SCCharts features.

On the one hand this eases the compilation and makes it more robust because it reduces its complexity. On the other hand, using Extended SCCharts features, a modeler is able to abstract away complexity of his or her SCCharts model which increases robustness and readability of a model. This approach enables a simple yet efficient compilation strategy and aids verification and certification.

Downloads

Downloads - KIELER SCCharts Product

The KIELER SCCharts Product includes the SCCharts editor and compiler.

Release 1.0.0

KIELER SCCharts Product v. 1.0 (2019-04-15, based on Eclipse 4.8 Photon). Available platforms:

- Linux: x86 32bit or x86 64bit
- Mac OS X: x86 64bit
- Windows: x86 32bit or x86 64bit

Nightly Builds

- <http://rtsys.informatik.uni-kiel.de/~kieler/files/nightly/sccharts/>
