Getting Started with Eclipse

Introduction

This guide will help get you set up to be able to work on your homework assignments. Yay! Get a cup of coffee and work your way through it.

First, you will have to decide between the following two options:

- 1. Working on the computer accounts we provide.
- 2. Working on your own laptop.

This guide will guide you through both of these options. We will first look at how to get each option set up properly. After that, we will look at the Eclipse development environment.

Getting Everything Ready and Installed

Working With the Accounts We Provide

Working with the accounts we provide has the advantage that most things are already set up for you. To do so, either go to the *Grundausbildungspool* (GAP; the thing we have our practicals in) in the basement of *Hermann-Rodewald-Straße 3* or login to the servers using your own computer. In both cases, you need to login with the credentials you got when you signed up for studying computer science (the user name will most likely be something like *stu0000*). To connect using your own computer, you need to download the *ThinLinc Software Client*, see "Terminalserver" on this site. Once you are logged in, you can find a development environment called *Eclipse* through the start menu.

Whatever way you choose: to get ready to work on your homework assignments, you do have to download the ACM Java library. Click this link and save the file somewhere you'll be able to find it again.

Working on Your Own Computer

To be able to work on your own computer, you need to make sure that you have three things installed:

- The Java Development Kit. If you're running Linux, you can probably simply install a Java package (usually called *OpenJDK*) from your package manager. If you're running Windows or Mac OS, go to this site, accept the license and download the distribution for your operating system.
- The Eclipse development environment. Simply follow this tutorial to install the Eclipse IDE for Java Developers.
- The ACM Java library most of our assignments use. Click this link and save the file somewhere you'll be able to find it again.

Working With Eclipse

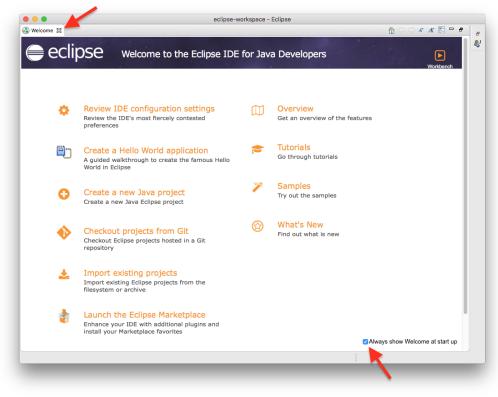

This section will help you get to grips with the Eclipse development environment. We'll start with a small tour around Eclipse, and finish by walking through all the steps necessary to actually write and execute your first Java program.

A Tour Through Eclipse

When you start Eclipse for the first time, you'll see something like the following dialogue that asks you for where you want your workspace to be saved:

	Eclipse IDE Lau	ncher	
elect a directory as v	workspace		
Eclipse IDE uses the w	orkspace directory to store its prefe	erences and development artifa	cts.
Workspace: VUsers/le-	cds/eclipse-workspace	V	Browse
<u></u>			
Use this as the defau	ult and do not ask again		
		Cancel	Launch

The workspace is where you will be saving all your homework. If you haven't worked with Eclipse before, just click OK and thereby accept the default location. Eclipse then loads and greets you with a nice welcome screen. Feel free to switch off the "Always show Welcome at start up" option at the bottom and dismiss the screen by clicking the X at the top.

What you see next is the actual Eclipse development environment that you'll be spending most of your time in:

) 😑 🕒			ws - Eclipse IDE					
💁 📄 🕤 🔪 🐎 ।	0 • • • •	😗 🖉 🖨 🔗 र 🖉 र 👘 र	\$\$ \$ + \$ + B			Quick Access	1	ł
Package Explorer 🔀						🗐 Task List 🔀	-	
	🖹 😫 🐉 🔻					🕆 🗄 📽 🕯	e 🗙 🖗	8
There are no projects in y To add a project:	our workspace.							
/ Create a Java proje	<u>ct</u>					Find •	Act	
Create a project							ur y Aca	
🚵 Import projects								
						문 Outline 없 💡	~ -	
						There is no active provides an outline		
		Problems 🔀 @ Javadoc 0 items	Declaration			±0 ∓		
		Description	∧ Resource	Path	Location	Type		

The window is divided into different areas. Most of them contain *views*, such as the *Package Explorer* to the left. The big empty area at the centre of the screen will house the Java source code editor, a text editor to write Java code with. You can drag views around, and close them as you wish. For example, you won't need the *Task List* during our lecture, so close it now. If you want to reopen a view you have closed, you can find a list of all available views through the menu by clicking *Window Show View Other*.

Writing and Executing Java Programs

To solve your homework assignments, you will need to know how to create new Java projects, add classes to them, and how to execute them. Let's start by creating a new project. Click the *File New Java Project*. This will open the following dialogue:

	last	New Java Project			
reate a Java Proj Enter a project nar					
Project name:					
Use default lo					
_	s/le-cds/Bin/Eclipse/Installa				Browse
JRE					
					_
-	cution environment JRE:		JavaSE-12		0
	ct specific JRE:		Java SE 13 [13]		\$
 Use default 	: JRE 'Java SE 13 [13]' and	workspace compiler preferences		<u>C</u>	onfigure JREs
Project layout					
O Use project	folder as root for sources	and class files			
📀 Create sepa	arate folders for sources an	nd class files		Cor	figure default
Working sets					
Add project	to working sets				New
Working sets:				0	Select
?		< Back	Next >	Cancel	Finish
0					

Enter a project name that describes the project. For your homework assignments, for example, you may want to create a separate project for each set of assignments, so a project name like "Set01" might work well for the first set. Leave the rest untouched and click *Finish*. You will probably see the following dialogue:

Module name:	Set01
Generate comm	ents (configure templates and default value here)
- Generate comm	Ente (compute templates and dordalt raide <u>intro</u>)

If that is the case, click the Don't Create button (things won't work otherwise).

Your Eclipse workspace will now contain an entry for the new project. Eclipse has to be told that you want to use the ACM library with that project. To configure it that way, right-click on the project, click on *Build Path* and select *Configure Build Path...*:

Package Explorer 🔀	- 8						E Outline 🕄	F
							An outline is not a	
► 聲 LeJavaProject	New Go Into	•						
	Open in New Window Open Type Hierarchy Show In て第W	F4						
	 Copy Copy Qualified Name Paste Delete 	¥C ¥V ⊠						
	🕭 Remove from Context 🛛 🔿 🕆							
	Build Path Source て#S Refactor て#T	•	論 Link Source	older				
	≥ Import ∠ Export		Use as Source Add External Add Libraries	Archives				
	🔗 Refresh Close Project Assign Working Sets	F5	💦 Configure Bu	ld Path				
	Coverage As Run As Debug As	* * *	Declaration					, ⊽ □ [
	Validate Restore from Local History Team Compare With Configure	* * *		Resource	Path	Location	Туре	
	Properties	۲						
JavaProject								

Remember the ACM library you downloaded? This is where we need it. Since you will be making use of that library, we need to configure the project such that it knows that the library exists. To that end, switch to the *Libraries* tab and select the *Classpath* entry (If there is no such entry, don't worry about it...):

(-+)+
♦ Order and Export Image: Constraint of the second s
Cancel Apply and Close

A library in Java is distributed as a file with a . jar file extension. Click on the Add External JARs button and select the downloaded ACM library (if you don't remember where you saved it, simply download the library again). Once you have found the library, it should show up in the dialogue. Click Apply and Close to dismiss the build path configuration and you're all set!

You are now ready to add your first class to your newly configured project. Right-click your new project in the Package Explorer and select New Class:

ava Class Create a new Java	class.	C
Source folder:	LeJavaProject/src	Browse
Package:	(default)	Browse
Enclosing type:		Browse
Name:		
Modifiers:	public Opackage Oprivate Oprotected	
	abstract final static	
Superclass:	java.lang.Object	Browse
nterfaces:		Add
		Add
		Tionove
Which method stub	s would you like to create?	
	public static void main(String[] args)	
	Constructors from superclass	
	Inherited abstract methods	
Do you want to add	comments? (Configure templates and default value here)	
	Generate comments	
?	Cancel	Finish

Give your class a proper name. The dialogue will tell you if your class name is valid or not. For the first few programming exercises, you want your class to extend a superclass, such as GraphicsProgram (to choose a superclass, click the corresponding *Browse* button). Also, be sure to click the strange box labelled public static void main(String[] args). The result may look something like this:

Source folder:	Set01/src	Browse
Package:	(default)	Browse
Enclosing type		Browse
Name:	RatherGoodClass	
Modifiers:	• public	
	🗌 abstract 🗌 final 📄 stat	
Superclass:	acm.program.GraphicsProgram	Browse
nterfaces:		Add
		Remove
Which method stu	ibs would you like to create?	
which method ste	volue you have to create?	
	Constructors from superclass	
	Inherited abstract methods	
Do you w 🕜 to ad	d comments? (Configure templates and default value here)	
	Generate comments	

Note that the dialogue still gives us a warning because we have left the package name empty. You can safely ignore that warning for the moment. There will come a time when you will actually use packages, but now is not that time. Instead, click *Finish*. Eclipse will create the class for you and open it in an editor for you to start writing code:

💁 🔚 🐚 🔅 ०० - 💁 🥵 🕑	• 🗁 🛷 • 🕭 📪 🕖 🐲 📴 🔳 👖 🔌 🖓 • 衍 • 🥬	⇔•⇔+ <u>∎</u>		Quick Access
Package Explorer S Set01 S	RatherGoodClass.java 32 RatherGoodClass.java 32 J tuport acm.program.GraphicsProgram; S public class RatherGoodClass extends GraphicsPro f public static void main(String[] args) { // TODD Auto-generated method stub // TODD Auto-generated method stub // 1000 Auto-generated			E Outine S I a v v v v v v v v v v v v v v v v v v
	Problems № @ Javadoc ֎ Declaration 0 errors, 1 warning, 0 others Description A grant	ource Path Lo	ocation	тар ,тр Туре

Let's say you have actually written a bit of code and want to see if it works. To do so, you will need to replace // TODO Auto-generated method stub with the following code:

new RatherGoodClass().start();

Of course, the class name (here RatherGoodClass) has to be replaced with the name you chose for your class.

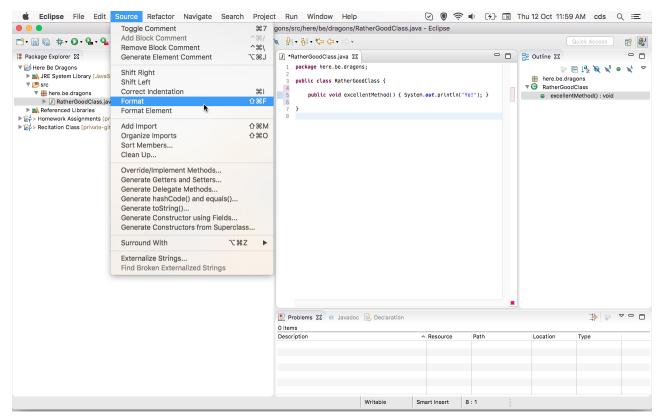

Now you're ready to run your program. Right-click your class in the Package Explorer and select Run As Java Application. If everything is fine, a window should pop up and your program should be executing. If instead Java cannot execute your program because of errors in your source code, Eclipse will tell you so:

	Errors in Workspace
	Errors exist in required project(s):
	LeJavaProject
	Proceed with launch?
Alw	ays launch without asking
	Cancel Proceed

In that case, hit Cancel and go hunt that error down. Remember the Problems view at the bottom of the Eclipse window? That's actually quite helpful for hunting down errors: it lists every error Eclipse was able to find. Double-clicking the error will jump to the offending part of the source code so you can fix it.

Formatting Source Code

The automatic tests we run on the source code you submit won't let you hand in badly formatted code. This is because we want to force you to write code that is properly readable. Fortunately, formatting your code properly is a matter of two clicks of a mouse button:

Importing Classes

There will be assignments where we ask you to import existing classes into your workspace. There are (at least) two ways to do so:

- 1. Right-click the destination folder in your Eclipse project and choose Import....
- 2. Use drag & drop.

We will now describe the latter. Start by downloading the respective class. Then, import it into your Java project by dragging and dropping it from your file explorer to your source folder, like this:

		eclipse-workspace -	Eclipse				
	🌯 • 🖶 🞯 • 🗁 🛷 • 🤭 🕲 •	· 🔌 : 읽 • 집 • 🏷 🔶	⊂) •			k Access	1
Package Explorer 🕱				-	D 🗄 Outline	x • ▼	- 6
E 😓	20 ▼				An outline is	s not available.	
🔻 🖼 LeJavaProject							
▶ ➡ JRE System Library [Jav (悪.src	vaSE-1.8]						
Referenced Libraries							
Drag & Drop							
iava							
.java							
.java HandyInt.java							
	Problems 52	Javadoc (D. Declaration				₹ 1	
		Javadoc 🚇 Declaration				4 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	- f
HandyInt.java	Problems 23 @ O items Description	Javadoc 😡 Declaration	∧ Resource	Path	Location	tion → Type	- (
FlandyInt.java	0 items	Javadoc 😥 Declaration	∧ Resource	Path	Location	41 0	- (
	0 items	Javadoc 😡 Declaration	Resource	Path	Location	41 0	-
Handyint.java	0 items	Javadoc 😥 Declaration	∧ Resource	Path	Location	41 0	-

Eclipse will ask you whether you want to copy the file into your project or just link to it. You want the former:

		eclipse-wo	rkspace - Eclips	е			
📬 - 🔄 🕼 🚸 - 💽 - 💁	• 💁 🖶 🧿	• 🗁 🔗 • 🔗 🖉) • 🔌 🖓 • 6	• *	Qu	ick Access	E
🛱 Package Explorer 🕱						📴 Outlin 🖾	- 6
	(2) 🔋 ▽						69
 LeJavaProject JRE System Library 	00	File	Operation			An outline is available.	not
P ■ ONE OFFICIATION CONTRIBUTION CONTRIBUTICON CONT	Select how file	es should be importe	d into the project:				
	💿 Copy f	les					
	🔵 Link to						
	🗹 Cre	ate link locations rela	tive to: PROJEC	T_LOC (
	Configure Dra	g and Drop Settings.	<u></u>				
	?		Cancel	ОК			
		Problems 😫	@ lavadoc 🕼 I	Declaration		1 1	▽ □ f
		0 items				-+1° 0	
		Description			Resource	e Path	

The imported file may declare to be in a different package than the one you imported it to, resulting in a compiler error. To fix that, simply open up the file, point the mouse cursor at the wrong package declaration, and choose to move the file to that package.

Allow Us to View Your Code

During the exercises, the instructors and assistants want to help you code and assist you if you run into problems that you cannot solve yourself. For this reason, we may want to have a look at your code to support you. As this is a little more difficult in an online teaching scenario and talking about your code while screensharing might limit us, we use CodeTogether as a code collaboration tool to help you. To install this in your Eclipse, visit this website and drag and drop the *Drag to Eclipse IDE* button directly into Eclipse. Make sure to drop it directly into the *Package Explorer*, as this dropping the link into the editor view does not start the installation process.
